Pricing updates launching **October 1, 2026**

We continue to invest in our pricing across business messaging – now including Meta Business Agent – to ensure it is compelling and makes it easy and attractive for businesses to choose WhatsApp as their preferred channel.

- As announced September 1, and consistent with our [published pricing calendar](#) – Meta will [update rates of 40 market-categories](#) to ensure rates are compelling and motivate adoption. The updates for 30 of these market-categories were announced in late May to provide not 1 but 4-month notice as we move an additional 9 markets out of their respective pricing region; set market-specific rates; and introduce a new, higher authentication-international rate across all 9.
- As announced July 1, 2026 – Meta will [charge for service messages on a per-message basis](#), with rates by market the same across utility, authentication and service messages. Additionally, to enable businesses to maintain an always-on presence on WhatsApp, Meta will introduce a monthly tier of 1,000 free service messages by business phone number, thus only charging as of the 1,001st service message each month. Last, service messages will continue to not be charged in the free entry point window.
- As announced July 1, 2026 – Meta will [charge for utility messages sent in response to users](#) (within the 24h customer service window), which have not been charged since July 1, 2025. Utility messages will continue to not be charged in the free entry point window.

To-be rates, including service message rates, are [now published](#). These take effect as of 12am by WhatsApp Business Account (WABA) timezone on October 1, 2026.

Rates effective Oct. 1, 2026

New payment methods

We continue to invest in billing solutions for business messaging to provide businesses more flexibility and make it easier for you to pay.

- For Meta Business Agent, we have introduced **credit and debit cards as a payment method**, to provide businesses more flexibility in how to pay.
- Additionally, for India only, we have introduced **UPI (Unified Payments Interface) as a pre-payment method**, to make it easier for businesses in India to pay the way they already do, instantly and at no additional cost. Businesses can choose to pay via UPI by creating a new WhatsApp Business Account. UPI can be leveraged across marketing, utility, authentication and service messages.

UPI as a pre-payment method in India

Launch: Updated WhatsApp Business Platform Account Structure & Conversation routing integrations

At the end of this month, we're rolling out the **new account structure on WhatsApp Business Platform, which allows a single phone number to support multiple integrations with independent billing**. Businesses can now unify all WhatsApp touchpoints—supported by partners, direct integration and Meta solutions like Meta Business Agent—under one unified brand identity and persistent conversation thread.

Here's what you can expect:

- **Account migration is automatic.** All accounts will be automatically migrated to the new structure by mid-October 2026. You'll see the updated accounts on all Meta surfaces, including Meta Business Suite and WhatsApp Manager. Inflight campaigns remain intact. You can preview what to expect with the account migration here: [deck](#), [video](#).
- **Get started with conversation routing integration.** To support clients using the same number for multiple integrations, **partners are highly encouraged** to integrate with additional webhooks and thread control APIs, which provide necessary conversation context and allow responders to coordinate thread ownership. [Learn more about conversation routing integrations here](#).
- **Embedded signup update.** All versions of embedded signup flows will also automatically reflect the new structure. Signup flow will allow sharing of an existing phone number and automatically create a messaging account for the partner, returning the messaging account ID in the existing WABA ID field. [Learn more](#).
- **Backward compatibility through H1 2028.** Existing Cloud API endpoints, phone number IDs, access tokens, template workflows, and conversation-based billing are unchanged, as the new WhatsApp account and messaging account identifiers are additive. [Learn more](#).

[New] Check a Contact Book entry using a BSUID

Cloud API partners and businesses can now use a read-only API to check whether a phone number is present in a Business Portfolio's Contact Book for a specific BSUID. No phone number is returned.

This can help businesses determine whether they need to ask a customer to share their contact information. The API currently checks one BSUID per request and returns present: true or present: false. The standard BSUID must belong to the same Business Portfolio as the business phone number. Parent BSUIDs are not supported.

Announcing MM API for WhatsApp, max price feature

Open Beta Launch on October 1

On October 1, the max price feature enters Open Beta, and all eligible partners and clients can use max price.* Max price enables businesses to **increase ROI** and have **more control over their marketing message spend**.

* [Geographic restrictions](#) apply (e.g., Europe), consistent with the geographic restrictions for our delivery optimizations.

Available now

- [Max price on existing marketing templates](#). Enable max price on templates businesses already have — no rebuild, no re-approval (if criteria met).
- [Fixed rate card / max price toggle](#). Switch a template between the fixed rate card and max price at any time via the Template API.
- [Template duplication](#). Duplicate an existing marketing template and apply a different max price.
- [Country-level multiplier](#). Adjust max price by market at send-time, without creating new templates.
- [Max price in WhatsApp Manager](#). End businesses can set max price directly in WhatsApp Manager — no API integration required for this workflow.

Coming soon

- (Tentatively Q4'26) **A dedicated SKU in billing for max price**. MM API for WhatsApp marketing templates with max price will show as its own line item on invoices, analytics APIs, and the pricing webhook.
- (Tentatively H1'27) **Error code update**. Two new error types to indicate if a higher max price can increase the likelihood of message delivery versus if the customer has reached their per-user marketing template message [limits](#).

Get started

Onboard to the MM API for WhatsApp max price feature ([Developer documentation](#)), and [learn more](#).
